

Secure and Simple - bi-Cube[®] SMS Token

The SMS Token is an additional, convenient and secure form of dual authentication in the Web: After the user has successfully logged on to any Web application by entering the user name and password, the program demands an additional input of a Token. In the Web mask itself, the user may request the SMS Token by one mouse click. "Just in Time" a multi-digit code is send to the user's cell phone. The mobile phone number and the authentication method is previously deposited into the bi-Cube[®] database.

The SMS Token is provided with a time stamp and therefore only usable within a specific, defined time frame, which optimally protects this type of uncomplicated, dual authentication from Phishing attacks. Also by using this procedure, the user does not have to carry with him additional hardware (code card, USB-stick etc.).
