

## Comfortable, Consequent and Save - *bi-Cube*® SSO

A Single Sign-On closes the security gap of forgotten and unsafe passwords. With only one logon to the operating system, all applications to be used by the user are available on the desktop. The user may activate each application from the desktop, and the Single Sign-On automatically takes over the login to the system.

By using this software solution, password-reset requests are eliminated and therefore the user help desk tremendously relieved, which at the same time, increases the work efficiency (cost benefit!). In addition, stricter password rules can be enforced by the Single Sign-On (security aspect!).

The integrated Logon Manager provides an additional protection to valuable applications with authentication methods such as: Fingerprint, SmartCard or Token. The convenient, dual authentication via biometric fingerprint can also be used in the Citrix environment.
