

Trust is good, Control is better - *bi-Cube*® USB-Blocker

The USB-Blocker is a save solution to control the access to storage media by an employee. The effective software permits the selective blocking or the targeted release of hardware components such as: USB sticks, external drives, printer, scanner or web cams. In addition, read and right authorizations can be defined for these devices.

By an intuitive user interface, the administrator may define the locking or selective releasing for the entire equipment or for individual devices. Once the user tries to connect an unauthorized device to the PC, a locked screen is displayed for a brief moment and the device is ejected. Thus, the USB-Blocker prevents data theft, unauthorized access to data as well as the import of malicious software.
